

15 EXPORTING ASSETS

Lesson overview

In this lesson, you'll learn how to do the following:

- Create pixel-perfect drawings.
- Use the Export For Screens command.
- Work with the Asset Export panel.
- Generate, export, and copy/paste CSS (Cascading Style Sheets) code.

This lesson takes approximately 30 minutes to complete. Please log in to your account on peachpit.com to download the lesson files for this chapter, or go to the “Getting Started” section at the beginning of this book and follow the instructions under “Accessing the lesson files and Web Edition.”

Your Account page is also where you'll find any updates to the chapters or to the lesson files. Look on the Lesson & Update Files tab to access the most current content.

You can optimize your Illustrator CC content for use on the Web, in apps, and in screen presentations using various methods. For example, you can easily export assets and save them for the web or apps, export CSS and image files, and generate SVG (Scalable Vector Graphics).

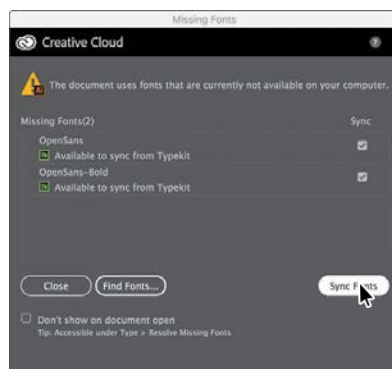

Starting the lesson

Before you begin this lesson, you'll restore the default preferences for Adobe Illustrator CC and open the lesson file.

● **Note:** If you have not already downloaded the project files for this lesson to your computer from your Account page, make sure to do so now. See the “Getting Started” section at the beginning of the book.

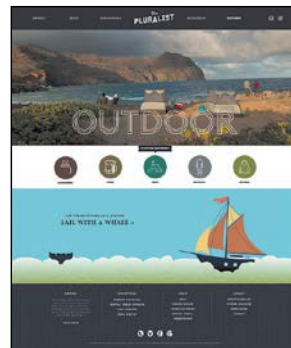

- 1 To ensure that the tools function and the defaults are set exactly as described in this lesson, delete or deactivate (by renaming) the Adobe Illustrator CC preferences file. See “Restoring default preferences” in the “Getting Started” section at the beginning of the book.
- 2 Start Adobe Illustrator CC.
- 3 Choose File > Open. In the Open dialog box, navigate to the Lessons > Lesson15 folder. Select the L15_start.ai file, and click Open. This lesson contains a fictitious business name, address, and website address for the purposes of the project.
- 4 The Missing Fonts dialog box will most likely appear. Click Sync Fonts to sync all the missing fonts to your computer (your list may not match the figure). After they are synced and you see the message stating that there are no more missing fonts, click Close.

● **Note:** If you can't get the fonts to sync, you can go to the Creative Cloud desktop application and choose Assets > Fonts to see what the issue may be (refer to the section “Changing font family and font style” in Lesson 8, “Adding Type to a Poster,” for more information on how to resolve it). You can also just click Close in the Missing Fonts dialog box and ignore the missing fonts as you proceed. A third method is to click the Find Fonts button in the Missing Fonts dialog box and replace the fonts with a local font on your machine.

● **Note:** If you don't see Reset Essentials in the Workspace menu, choose Window > Workspace > Essentials before choosing Window > Workspace > Reset Essentials.

- 5 Choose Window > Workspace > Reset Essentials to ensure that the workspace is set to the default settings.
- 6 Choose View > Fit Artboard In Window.
- 7 Choose File > Save As. In the Save As dialog box, navigate to the Lessons > Lesson15 folder, and name the file **AssetExport.ai**. Leave the Format option set to Adobe Illustrator (ai) (macOS) or the Save As Type option set to Adobe Illustrator (*.AI) (Windows) and then click Save. In the Illustrator Options dialog box, leave the Illustrator options at their default settings and then click OK.
- 8 Choose Select > Deselect, if necessary.

Creating Pixel-Perfect Drawings

When creating content for use on the Web, in mobile apps, in onscreen presentations, and more, it's important that images saved from vector art look sharp. To enable designers to create pixel-accurate designs, you can align artwork to the pixel grid using the Snap To Pixel option. The *pixel grid* is a grid of 72 squares per inch, vertically and horizontally, that is viewable when you zoom to 600% or higher with Pixel Preview mode enabled (View > Pixel Preview).

Pixel-aligned is an object-level property that enables an object to have its vertical and horizontal paths aligned to the pixel grid. This property remains with the object when the object is modified. Any vertical or horizontal path in the object gets aligned to the pixel grid as long as the property is set for it.

Aligning new artwork to the pixel grid

When Snap To Pixel (View > Snap To Pixel) is enabled, shapes that are drawn, modified, or transformed appear crisp. This makes most artwork, including most Live Shapes, align to the pixel grid automatically. In this first section, you'll explore the pixel grid and how to align new content to it.

- 1 In the AssetExport.ai file, choose File > Document Color Mode, and you will see that RGB Color is selected.

When designing for onscreen viewing (web, apps, etc.), RGB (Red, Green, Blue) is the preferred color mode for documents in Illustrator. When you create a new document (File > New), you can choose which color mode to use with the Color Mode option. In the New Document dialog box, choosing any document profile, *except* for Print, sets Color Mode to RGB by default.

- 2 Select the Selection tool (V), and click to select the brown circle with the word "ACCESSORIES" beneath it. Press Command++ (macOS) or Ctrl++ (Windows) several times to zoom in closely to the selected artwork.
- 3 Choose View > Pixel Preview to preview a rasterized version of the design.

Preview mode

Pixel Preview mode

When you export assets in a format such as GIF, JPG, or PNG, any artwork that was vector is rasterized in the resulting file. Turning on Pixel Preview is a great way to be able to see what the artwork will look like when it's rasterized.

Tip: After you create a document, you can change the document color mode using File > Document Color Mode. This sets the default color mode for all new colors you create and the existing swatches. RGB is the correct color mode to use when creating content for the Web, for apps, or for onscreen presentations.

Tip: You can **to**ff the pixel grid by choosing **Illustrator CC > Preferences > Guides & Grid (macOS) or Edit > Preferences > Guides & Grid (Windows)** and deselecting **Show Pixel Grid (Above 600% Zoom)**.

Note: As of the writing of this book, the creation tools affected by **Snap To Pixel** are the **Pen tool**, the **Curvature tool**, shape tools like the **Ellipse tool** and the **Rectangle tool**, the **Line Segment tool**, the **Arc tool**, **Grid tools**, and the **Artboard tool**.

Tip: You can also click the **Snap To Pixel** option in the **Properties panel** with nothing selected and the **Selection tool** selected, or you can select the **Align Art To Pixel Grid** option (☑) on the right end of the **Control panel** (**Window > Control**).

- 4 Choose 600% from the **View** menu in the lower-left corner of the **Document window** (in the **Status bar**), and make sure you can still see the brown circle above the “**ACCESSORIES**” text.

By zooming in to at least 600% and with **Pixel Preview** turned on, you can see a pixel grid appear. The pixel grid divides the artboard into 1 pt. (1/72-inch) increments. For the next steps, you need to see the pixel grid (zoom level of 600% or greater).

- 5 Click to select one of the white paths on the brown circle.

This is an easy way to set the stroke and fill formatting for the next object drawn to match the selected artwork.

- 6 Select the **Rectangle tool** (□) in the **Tools panel**. Draw a simple rectangle on the brown circle.

You might notice that the edges of the rectangle look a little “fuzzy.” That’s because in this document, **Snap To Pixel** is turned off.

- 7 Press **Delete** or **Backspace** to remove the rectangle.

- 8 Choose **View > Snap To Pixel** to turn on **Snap To Pixel**.

Now, any shapes that are drawn, modified, or transformed will snap to the pixel grid if possible. By default, **Snap To Pixel** is turned on when you create a new document that uses the **Web** or **Mobile** document profile.

- 9 With the **Rectangle tool** selected, draw a simple rectangle to complete the coffee cup on the brown circle, and notice that the edges are “cleaner.”

The vertical and horizontal segments of the drawn artwork snap to the pixel grid. In the next section, you’ll see that you can snap existing artwork to the pixel grid. In this case, I had you redraw the shape just to see the difference.

- 10 Select the Selection tool (⌘), and drag the rectangle into position like you see in the figure. You may need to resize the rectangle to look better.

Aligning existing artwork to the pixel grid

You can also align existing artwork to the pixel grid in several ways, as you will do in this section.

- 1 Select the Selection tool (⌘), and click to select the rounded rectangle above the rectangle you drew.
- 2 Click the Align To Pixel Grid button in the Properties panel to the right (or choose Object > Make Pixel Perfect).

The rounded rectangle was created when Align To Pixel Grid wasn't selected. After the rectangle was aligned to the pixel grid, the horizontal and vertical straight edges were snapped to the closest pixel grid lines. Live Shapes and Live Corners are preserved when doing this.

Objects that you pixel-align that do not have any straight vertical or horizontal segments are not modified to align to the pixel grid. For example, because a rotated rectangle does not have straight vertical or horizontal segments, it is not nudged to produce crisp paths when the pixel-aligned property is set for it.

● **Note:** The Align To Pixel Grid button does not appear in the Properties panel when an open path is selected.

- 3 Click to select one of the wavy white lines above the rounded rectangle, which selects a group of lines. Choose Object > Make Pixel Perfect.

You will see a message in the Document window, “Selection Contains Art That Cannot Be Made Pixel Perfect.” In this case, this means there are no vertical or horizontal straight edges to align.

- 4 Click the white “handle” shape on the right side of the coffee mug. Press Command++ (macOS) or Ctrl++ (Windows) several times to zoom in closely to the selected artwork.
- 5 Drag the upper-right corner bounding point to make the handle a bit larger.

After dragging, notice that resizing the shape using the corner or side handles fixes the *corresponding* edges (snaps them to the pixel grid) but not all of them.

- 6 Choose Object > Make Pixel Perfect to ensure that all of the vertical or horizontal straight edges are aligned to the pixel grid.
- 7 Choose Select > Deselect (if available) and then choose File > Save.

● **Note:** Moving artwork is constrained to be in whole pixels when transforming via the Selection tool, Direct Selection tool, Live Shape center widget, arrow keys, and Artboard tool. The Direct Selection tool snaps anchor points and handles to pixel or subpixel locations depending on the stroke settings of the path. This snap is similar to the Pen tool snap during creation.

Exporting artboards and assets

In Illustrator, using the File > Export > Export For Screens command and the Asset Export panel, you can export entire artboards, perhaps to show a design in progress, or selected assets. The exported content can be saved in several file formats, such as JPEG, SVG, PDF, and PNG. These formats are optimized for use on the Web, devices, and onscreen presentations and are compatible with most browsers, yet each has different capabilities. The selected artwork is automatically isolated from the rest of the design and saved as an individual file.

Tip: To learn more about working with web graphics, search for “File formats for exporting artwork” in Illustrator Help (Help > Illustrator Help).

Slicing content

In the past, before the Export For Screens command or the Asset Export panel, you needed to isolate artwork you wanted to export. This was done by placing the artwork on its own artboard or by slicing the content. In Illustrator, you can create slices to define the boundaries of different web elements in your artwork. When you save the artwork using the File > Export > Save For Web (Legacy) command, you can choose to save each slice as an independent file with its own format and settings.

It is not necessary to isolate artwork by slicing when using the File > Export > Export For Screens command or Asset Export panel since artwork is isolated automatically.

Note: To learn more about creating slices, search for “Create slices” in Adobe Illustrator Help (Help > Illustrator Help).

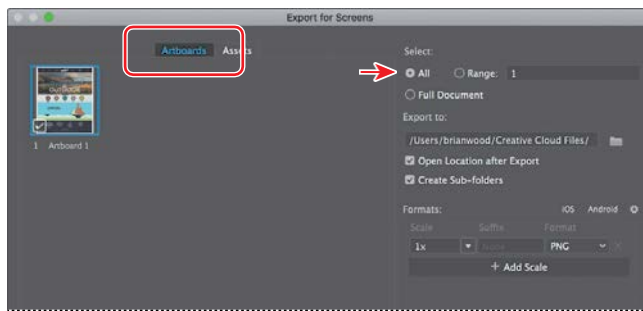

Exporting artboards

In this section, you’ll see how to export artboards in your document. This could be useful if you want to show someone a design you are working on or to capture a design for use in a presentation, website, app, or other.

- 1 Choose View > Fit Artboard In Window.
- 2 Choose File > Export > Export For Screens.

In the Export For Screens dialog box that appears, you can choose between exporting artboards and exporting assets. Once you decide what to export, you can set export settings on the right side of the dialog box.

- 3 With the Artboards tab selected, on the right side of the dialog box, ensure that All is selected.

You can choose to export all or a specific range of artboards. This document has only one artboard, so selecting All is the same as selecting a range of 1. Selecting Full Document will export all artwork in a single file.

- 4 Click the folder icon  to the right of the Export To field. Navigate to the Lessons > Lesson15 folder, and click Choose (macOS) or Select Folder (Windows).
- 5 Click the Format menu, and choose JPG 80.

In the Formats section of the Export For Screens dialog box, you can set a Scale factor for the exported asset, create (or in this case edit) a suffix for the filename, and change the format. You can also export multiple versions with different scale factors and formats by clicking the + Add Scale button.

Tip: To avoid creating subfolders, like the folder “1x,” you can deselect Create Sub-folders in the Export For Screens dialog box when exporting.

- 6 Click Export Artboard.
The Lesson15 folder should open, and you should see a folder named “1x” and, in that folder, an image named “Artboard 1-80.jpg.” The “-80” suffix refers to the quality you set when exporting.
- 7 Close the folder, and return to Illustrator.

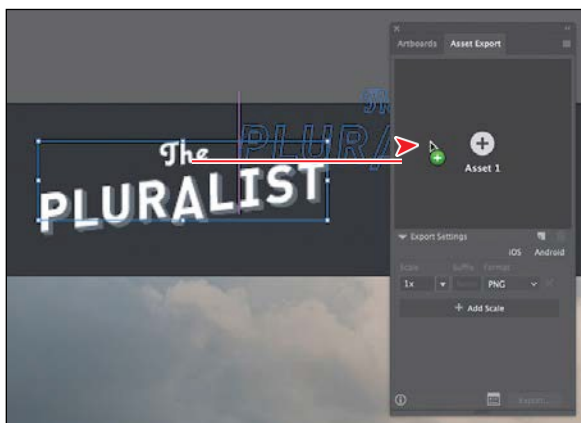

Exporting assets

You can also quickly and easily export individual assets in file formats such as JPG, PNG, and SVG using the Asset Export panel. The Asset Export panel lets you collect assets that you might export frequently and can be a great tool for web and mobile workflows because it allows for the export of multiple assets with a single click. In this section, you'll open the Asset Export panel and see how to both collect artwork in the panel and use it to export that collected artwork.

- 1 With the Selection tool (V) selected, click to select the white “Pluralist” logo at the top of the artboard.
- 2 Press Command++ (macOS) or Ctrl++ (Windows) several times to zoom in closely to the logo.
- 3 With the logo selected, choose Window > Asset Export to open the Asset Export panel.

The Asset Export panel is where you can save content for export now or later. It can work in conjunction with the Export For Screens dialog box to set export options for the selected assets, as you'll see.

- 4 Drag the selected Pluralist logo into the top part of the Asset Export panel. When you see a plus sign (+) appear, release the mouse button to add the artwork to the Asset Export panel.

The artwork you added to the panel is now called “pluralist” or something similar. The asset is tied to the original artwork in the document. In other words, if you update the artwork in the document, the asset is updated in the Asset Export panel. Every asset you add to the Asset Export panel is saved with the panel and will be in there until you delete it from either the document or the Asset panel. You can also drag multiple objects into the Asset Export panel, and each will be saved as a separate asset.

Tip: If you Option-drag (macOS) or Alt-drag (Windows) multiple objects into the Asset panel, the selected content will become a single asset in the Asset Export panel.

Note: There are several methods for exporting artwork in a variety of formats. You can select artwork in your Illustrator document and choose File > Export Selection. This adds the selected artwork to the Asset Export panel and opens the Export For Screens dialog box. You can choose from the same formats you saw in the previous section.

Tip: To add artwork to the Asset Export panel, you can also right-click the artwork in the Document window and choose Collect For Export > either As Single Asset or As Multiple Assets.

Tip: To delete an asset from the Asset Export panel, you can either delete the original artwork in the document or select the asset thumbnail in the Asset Export panel and click the Remove Selected Assets From This Panel button.

● **Note:** You may need to double-click to edit the name.

- 5 Click the name of the asset in the Asset Export panel, and rename it **PluralistLogo**.

The asset name that appears is based on what the artwork is named in the Layers panel. Also, how you name assets in the Asset Export panel is up to you. I name them so later I can more easily keep track of what each asset is used for.

- 6 Click the Pluralist logo asset thumbnail to select it in the Asset Export panel.

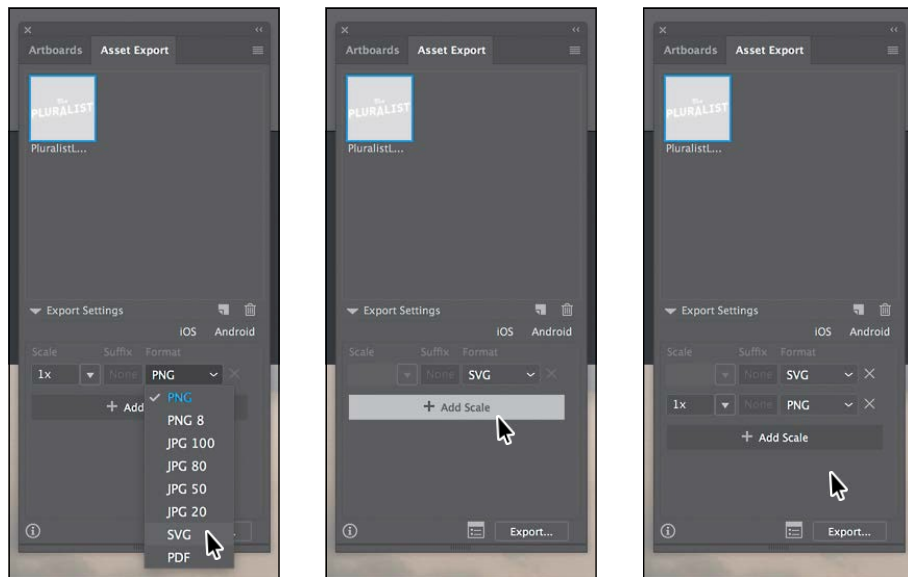

As you add more and more assets to the panel using various methods, you will need to first select the assets you'd like to export.

- 7 In the Export Settings area of the Asset Export panel, choose SVG from the Format menu, if necessary.

The SVG is perfect for the website, but in this case, a co-worker has asked for a PNG version of the same logo as well.

- 8 Click the + Add Scale button below the SVG option in the panel to export the artwork in another format (in this case). Change Scale to 1x and ensure that Format is PNG.

● **Note:** If you are creating assets for use on iOS or Android, you could also click the iOS or Android options to create a series of scaled export options, by default.

This sets the format for all of the selected assets in the Asset Export panel. You can also set a scale (1x, 2x, etc.) if you need multiple scaled versions of the selected assets—perhaps for Retina and non-Retina displays when it comes to formats like JPEG or PNG. You can also add a suffix to the exported file name. A suffix could be something like “@1x” to indicate the 100% scaled version of an exported asset.

- 9 With the PluralistLogo thumbnail selected at the top of the Asset Export panel, click the Export button at the bottom of the Asset Export panel to export the selected asset. In the dialog box that appears, navigate to the Lessons > Lesson15 > Asset_Export folder, and click Choose (macOS) or Select Folder (Windows) to export the assets.

Both the SVG file (PluralistLogo.svg) and the PNG file (PluralistLogo.png) will be exported to the Asset_Export folder in separate folders.

You can also click the Launch The Export For Screens Dialog button (📱) at the bottom of the Asset Export panel. This will open the Export For Screens dialog box where you can set all of the same settings, including a few more.

Creating CSS from your design

● **Note:** Exporting or copying CSS from Illustrator CC *does not* create HTML for a web page. It is intended to create CSS that is applied to HTML you create elsewhere, such as in Adobe Dreamweaver.

If you are building a website or want to hand off content to a developer, you can transform the visual designs you create in Illustrator to Cascading Style Sheets styles using the CSS Properties panel (Window > CSS Properties) or File > Export > Export As command. *Cascading Style Sheets* is a specification for formatting rules, much like paragraph and character styles in Illustrator, that control the appearance of content in a web page. Unlike paragraph and character styles in Illustrator, CSS can control not only the look and feel of text but also the formatting and positioning of page elements found in HTML.

```
1  html {
2      font-family: sans-serif;
3      -webkit-text-size-adjust: 100%;
4      -ms-text-size-adjust: 100%;
5  }
6  body {
7      margin: 0;
8  }
9  a:focus {
10     outline: thin dotted;
11 }
12 a:active, a:hover {
13     outline: 0;
14 }
15 h1 {
16     font-size: 2em;
17     margin: 0 0 0.2em 0;
18 }
```

An example of CSS code.

The great thing about generating CSS from your Illustrator artwork is that it allows for flexible web workflows. You can export all of the styling from a document, or you can just copy the styling code for a single object or a series of objects and paste it into an external web editor, like Adobe Dreamweaver. This can be a great way to move the styling from your web design in Illustrator straight to your HTML editor or to hand it off to a web developer. But creating CSS styling and using it effectively requires a bit of setup in your Illustrator CC document, and that's what you'll learn about next.

● **Note:** To learn more about CSS, visit the "Understand Cascading Style Sheets" section of Adobe Dreamweaver Help (<https://helpx.adobe.com/dreamweaver/using/cascading-style-sheets.html>).

Setting up your design for generating CSS

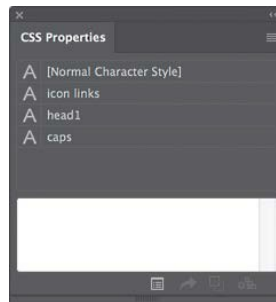

If you intend to export or copy and paste CSS from Illustrator CC, setting up the Illustrator CC file properly before creating CSS allows you to name the CSS styles that are generated. In this section, you'll look at the CSS Properties panel and see how you can set up the content for style export using *named* or *unnamed* content.

- 1 Choose Window > Workspace > Reset Essentials.
- 2 Choose Select > Deselect, if available.
- 3 Choose View > Fit Artboard In Window and then press Command+– (macOS) or Ctrl+– (Windows) to zoom out.
- 4 Choose Window > CSS Properties to open the CSS Properties panel. Using the CSS Properties panel, you can do the following:
 - Preview CSS code for selected objects.
 - Copy CSS code for selected objects.
 - Export generated styling for selected objects to a CSS file (along with any images used).
 - Change options for the CSS code exported.
 - Export the CSS for all objects to a CSS file.
- 5 With the Selection tool (☛) selected, click to select the blue rectangle behind the navigation and logo at the top of the artboard (see the following figure).

In the CSS Properties panel you'll see a message in the preview area. Instead of CSS code (which is what the preview area typically shows), the message states that the object needs to be named in the Layers panel or you need to allow Illustrator to create styling from “unnamed objects.”

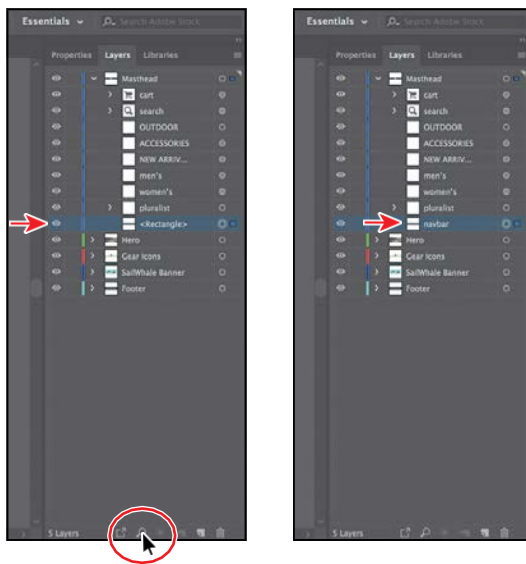

- 6 Open the Layers panel (Window > Layers), and click the Locate Object button (🔍) at the bottom of the panel to easily find the selected object in the panel.

● **Note:** You may need to drag the left edge of the Layers panel to the left to see the entire name of the object.

● **Note:** The content for the sublayer named “pluralist” may be showing in your Layers panel and that’s okay.

- 7 Double-click directly on the name of the selected <Rectangle> object in the Layers panel, and change the name to **navbar** (lowercase). Press Return or Enter to make the change.

- 8 Look in the CSS Properties panel again, and you should see a style named .navbar in the preview area. Drag the bottom of the panel down to show more.

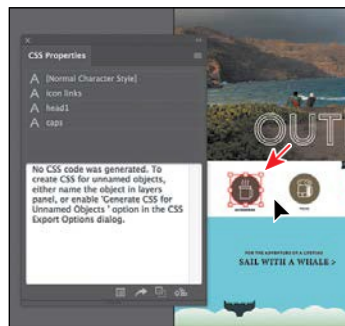

● **Note:** If you see a style named “.navbar_1_,” it’s usually because there is an extra space after the name “navbar” in the Layers panel.

🔑 **Tip:** You can tell a style is a *class* in CSS because the name has a period (.) before it.

When content is unnamed in the Layers panel (it has the default naming), a CSS style is not created for it, by default. If you name the object in the Layers panel, the CSS is generated, and the name of the style created matches the object name in the Layers panel. Illustrator creates styles called *classes* for most content.

For objects in the design (not including text objects, as you will see), the name you give them in the Layers panel should match the class name in the HTML that is created in a separate HTML editor, like Dreamweaver. But, you can also forgo naming the objects in the Layers panel and simply create generic styles that you can then export or paste into an HTML editor and name there. You will see how to do that next.

- 9 With the Selection tool, click to select the brown circle behind the cup you worked with earlier. In the CSS Properties panel, a style will not appear since the object is unnamed in the Layers panel (it just has the generic <Path> name).

- 10 Click the Export Options button () at the bottom of the CSS Properties panel.

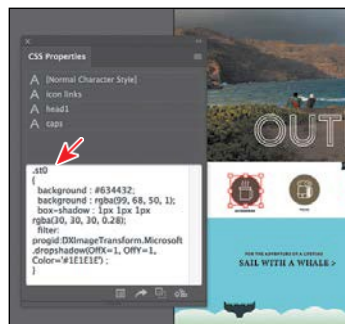

The CSS Export Options dialog box that appears contains export options that you can set, such as which units to use, which properties to include in the styles, and other options, such as which Vendor prefixes to include.

- 11 Select Generate CSS For Unnamed Objects, and click OK.

- 12 With the brown circle still selected, a style named “.st0” appears in the preview area of the CSS Properties panel.

.st0 is short for “style 0” and is a generic name for the formatting that is generated. Every object that you don’t name in the Layers panel will now be named .st1, .st2, and so on, after turning on Generate CSS For Unnamed Objects. This type of style naming can be useful if, for instance, you are creating the web page yourself and you are going to paste or export the CSS from Illustrator and name it in your HTML editor or if you simply needed some of the CSS formatting for a style you already have in your HTML editor.

- 13 Choose Select > Deselect and then choose File > Save.

Working with character styles and CSS code

● **Note:** Currently, paragraph styles are not taken into account when naming styles in the CSS code that is generated.

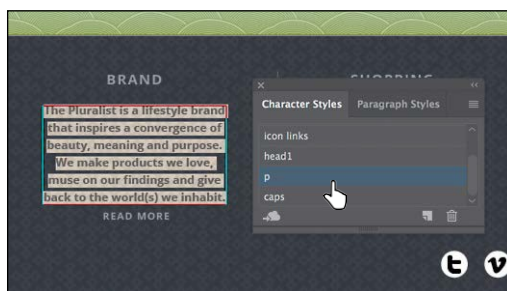

Illustrator will create CSS styles based on text formatting, as well. Formatting, such as font family, font size, leading (called *line-height* in CSS), color, kerning and tracking (collectively called *letter-spacing* in CSS), and more, can be captured in the CSS code. Any character styles that are applied to text in your design are listed in the CSS Properties panel as a CSS style and have the same name as the character style. Text that has formatting applied, without a character style applied, will have a generic CSS style name when Illustrator generates the style.

Next, you'll create and then apply a character style to text.

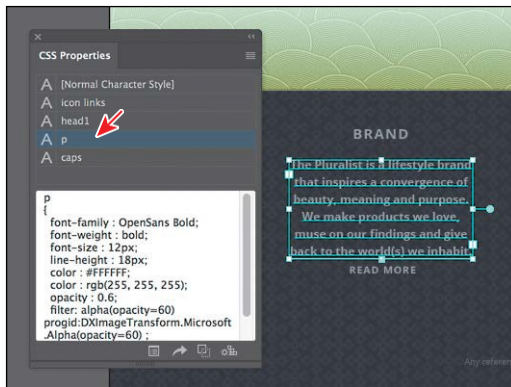

- 1 In the CSS Properties panel, notice the style named [Normal Character Style], toward the top of the panel.

In the CSS Properties panel, only character styles that are applied to text appear. The Normal Character Style is applied to text by default, so it appears in the CSS Properties panel. If you create character styles but don't apply them to text, they will not appear in the CSS Properties panel.

- 2 Choose Window > Type > Character Styles to open the Character Styles panel.
- 3 With the Selection tool (⬚) selected, click to select the paragraph of text *below* the heading "BRAND," on the left end of the footer.
- 4 Press Command++ (macOS) or Ctrl++ (Windows) several times to zoom in to the text.
- 5 Select the Type tool (T) in the Tools panel. Select the entire paragraph that begins with "The Pluralist is a lifestyle brand...."
- 6 Click the style named "p" in the Character Styles panel to apply it to the selected text.

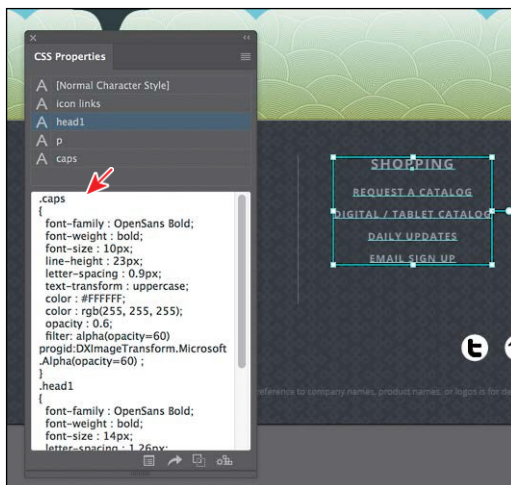

- 7 Select the Selection tool (⌘), and with the text object still selected, you will see the character style named “p” in the CSS Properties panel list. This indicates that it is applied to text in the design. You will also see CSS code in the preview area of the panel.

Selecting a text object (not the text) will show all the generated CSS code for the styling used in the entire text area. With the text selected, the CSS is not shown in the CSS Properties panel.

- 8 With the Selection tool, click the type object in the footer that contains the “Shopping” heading. Look in the CSS Properties panel, and you will see a series of CSS styles listed. These are the styles applied to *all* the text in the type area. You may want to drag the bottom of the CSS Properties panel down to see more of the styling.

Selecting a type area gives you the ability to see all the CSS code generated from the styling. It is also a great way to be able to copy or export all the text formatting from a selected type area.

Tip: You can also use the character styles listed in the CSS Properties panel as a way to apply the styles to text.

Note: The ordering of the styles you see in the CSS Properties panel may not match the figure and that’s okay.

Working with graphic styles and CSS code

CSS code can also be copied or exported for any graphic styles that are applied to content. Next, you'll apply a graphic style and see the generated CSS code.

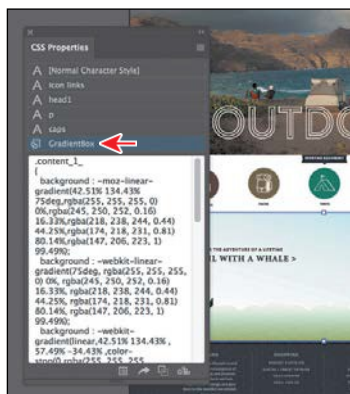

- 1 Choose View > Fit Artboard In Window. With the Selection tool (⌘), click to select the blue rectangle behind the ship. You may want to zoom out a bit.
- 2 Choose Window > Graphic Styles. In the Graphic Styles panel, click the graphic style named “GradientBox.” You can close the Graphic Styles panel group.

Tip: Like the  character style in the CSS Properties panel to apply the formatting, you can also select content and select a graphic style listed in the CSS Properties panel to apply it.

Looking in the CSS Properties panel, you will see the graphic style named “GradientBox” now listed, because it is applied to content in your document.

You will also see CSS code for a style. Mine is named “.content_1_,” but yours may be different. The CSS code is generated from the GradientBox graphic style you just saw since that graphic style is applied. But it's not naming the style with the “GradientBox” name since the graphic style is just a way to apply formatting. Remember, this is an unnamed CSS style because you didn't rename the selected object (the rectangle) in the Layers panel.

- 3 Leave the rectangle selected and then choose File > Save.

Copying CSS

At times, you may need to capture only a bit of CSS code from part of your design to paste into your HTML editor or to send to a web developer. Illustrator lets you copy and paste CSS code easily. Next, you'll copy the CSS for a few objects and learn about how grouping can change the way CSS code is generated.

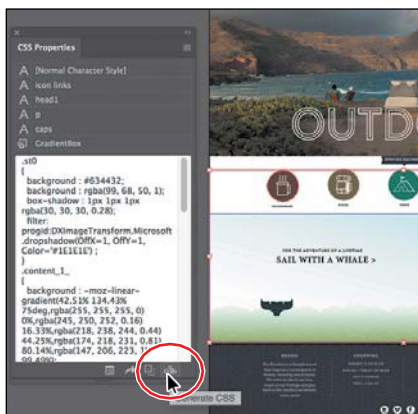

- 1 With the rectangle still selected, click the Copy Selected Style button (📄) at the bottom of the CSS Properties panel. This copies the CSS code currently showing in the panel.

Next, you will select multiple objects and copy the generated CSS code at the same time.

- 2 With the Selection tool (🔍) selected and the rectangle still selected, Shift-click the brown circle to select both objects.

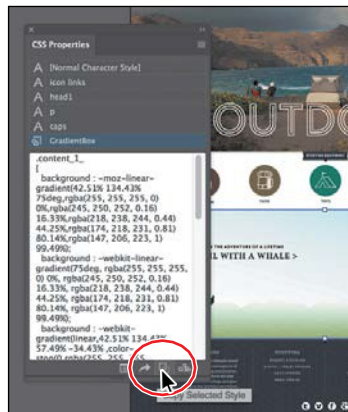

In the CSS Properties panel, you will not see any CSS code since you need to tell Illustrator to generate CSS code for more than one selected object.

- 3 Click the Generate CSS button (🔧) at the bottom of the panel.

The code for two CSS styles, `.st0` and `.content_1_`, now appears in the preview area of the CSS Properties panel. Your style names may be different, and that's okay. To see both styles, you may need to scroll down in the panel. Yours may also be in a different order, and that's okay.

With both styles showing in the CSS Properties panel, you could copy the styles and paste them into your HTML editor code or paste them into an email to send to a web developer, for instance.

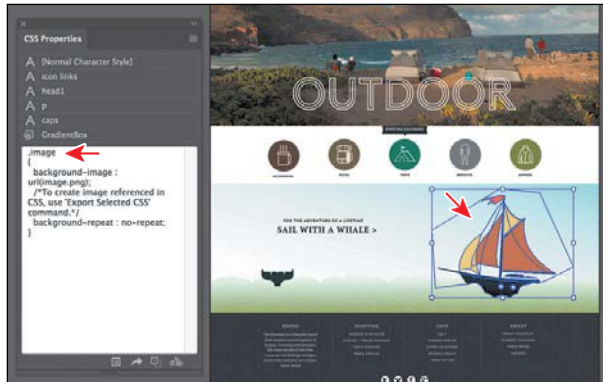

● **Note:** You may see a yield sign icon (⏸) at the bottom of the panel when certain content is selected. It indicates that not all of the Illustrator appearance attributes (such as the multiple strokes applied to the shape) can be written in the CSS code for the selected content.

🔧 **Tip:** When CSS `id` appears in the CSS Properties panel for selected content, you can also select part of the code, right-click the selected code, and then choose Copy to copy just that selection.

● **Note:** The styling or naming you see may be different, and that's okay.

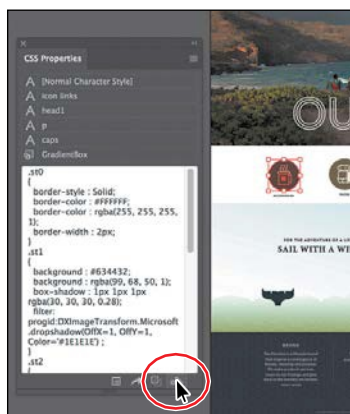

- 4 With the Selection tool, click to select the ship.

In the CSS Properties panel, you will see CSS code for an .image style. That code contains a background-image property. When Illustrator encounters artwork (or raster images) that it can't make CSS code from or a group of objects, it rasterizes the exported content (*not* the artwork on the artboard) when you export the CSS code. The CSS code that is generated can be applied to an HTML object, like a div, and the PNG image will be applied as a background image in the HTML object.

- 5 Drag a marquee selection across the brown circle and cup shapes to select them.
- 6 Click the Generate CSS button (⌘+⌘) at the bottom of the CSS Properties panel to generate the CSS code for the selected artwork.

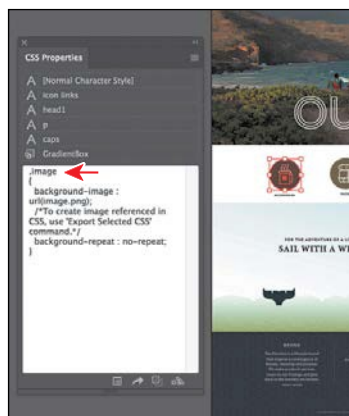

● **Note:** The styling you see may be different, and that's okay.

You will see the CSS code for all the selected objects in the panel. If you were to copy the CSS code now, the images would not be created, only the code referring to them. To generate the images, you need to export the code, which you will do in the next section.

- 7 Choose Object > Group to group the objects together. Leave the group selected for the next section.

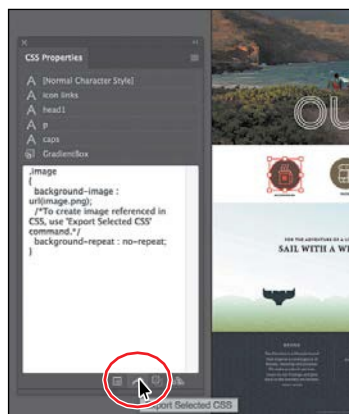

Notice that, in the CSS Properties panel, a single CSS style is now showing (.image). Grouping content tells Illustrator to create a single image (in this case) from the grouped content. Having a single web image would most likely be better if you intend on placing it on a web page.

Exporting CSS

You can also export part or all of the CSS code for your page design. Exporting CSS code has the distinct advantages of creating a CSS file (.css) and exporting PNG files for content that is considered unsupported. In this section, you will see both methods.

- 1 With the group still selected, click the Export Selected CSS button (📄) at the bottom of the CSS Properties panel.
- 2 In the Export CSS dialog box, make sure that the filename is AssetExport. Navigate to the Lessons > Lesson15 > CSS_Export folder, and click Save to save a CSS file named AssetExport.css and a PNG image file.
- 3 In the CSS Export Options dialog box, leave all settings at default, and click OK.
- 4 Go to the Lessons > Lesson15 > CSS_Export folder on your hard drive. In that folder, you should now see the AssetExport.css file and an image named image.png.

Tip: You can choose a resolution for rasterized artwork in the CSS Export Options dialog box. By default, it uses the Document Raster Effects resolution (Effect > Document Raster Effects Settings).

As stated earlier, the CSS code that was generated assumes that you are going to apply the CSS styling to an object in your HTML editor and that the image will become a background image for the object. With the image generated, you can use it for other parts of your web page as well. Next, you'll export all the CSS from the design.

- 5 Back in Illustrator, choose File > Export > Export As. In the Export dialog box, set the Format option to CSS (css) (macOS) or the Save As Type option to CSS (*.CSS) (Windows). Change the filename to **AssetExport_all**, and make sure that you navigate to the Lessons > Lesson15 > CSS_Export folder. Click Export.

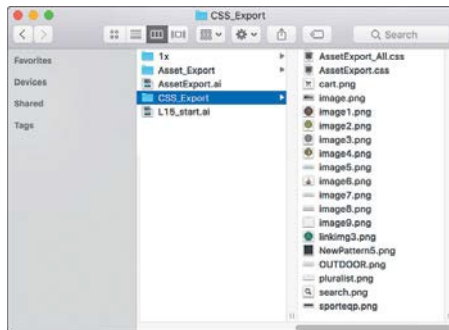

Note: You can also export all of the CSS from your design by choosing Export All from the CSS Properties panel menu. If you want to change the export options first, you can set them by clicking the Export Options button (⚙️) at the bottom of the CSS Properties dialog box.

- 6 In the CSS Export Options dialog box, leave all the options at their default settings, and click OK. You most likely will see a dialog box telling you that images will be overwritten. Click OK.

Position and size properties are not added to the CSS code by default. In certain situations, you will need to export CSS with those options selected. The Include Vendor Pre-fixes option is selected by default. *Vendor prefixes* are a way for certain browser makers (each is listed in the dialog box) to add support for new CSS features. You can choose to exclude these prefixes by deselecting them.

● **Note:** Your file sorting and icons may look different in the CSS_Export folder, and that's okay.

- 7 Go to the Lessons > Lesson15 > CSS_Export folder, and you will see the new CSS file named AssetExport_all.css and a series of images created because the Rasterize Unsupported Art option was selected in the CSS Export Options dialog box.

- 8 Return to Illustrator, and choose Select > Deselect.
- 9 Choose File > Close to close the file. Save the file if asked.
