2015 #1

A. The median salary ($150,000) is the same for both corporations. The spread for Corporation A is much greater than Corporation B. Corporation has 2 outlier salaries, while Corporation B has none.

B. (i) I could make more money at Corporation A. There are at least 3 salaries at A higher than the max of B, so I have the potential to make more at A, than anyone at B.

(ii) At B, I am guaranteed a raise, whereas at A, there are some people making the $36,000 they started at. The minimum at B is higher than the minimum at A, so if I'm at the bottom of scale, I will earn more.
